Progressive Retinal Atrophy (PRA4) - PCR

Result: Genotype N/N

Interpretation: The examined animal is homozygous for the wildtype-allele. It does not carry the causal mutation for PRA4 in the IMPG2 gene.

Trait of inheritance: autosomal recessive

Scientific studies found correlation between the mutation and symptoms of the disease in the following breeds:
Lhasa Apso

The current result is only valid for the sample submitted to our laboratory. The sender is responsible for the correct information regarding the sample material. The laboratory can not be made liable. Furthermore, any obligation for compensation is limited to the value of the tests performed.

There is a possibility that other mutations may have caused the disease/phenotype. The analysis was performed according to the latest knowledge and technology.

The laboratory is accredited for the performed tests according to DIN EN ISO/IEC 17025:2018. (except partner lab tests).

Laboklin App

Tick season has begun!

We offer different PCR profiles for humans and animals to examine for vector-borne infections in ticks, for example the frequently detected Borrelia, TBE and Anaplasma. Please send the tick as a whole in a non-breakable and well sealable container.
